

DevOps Tech Case

Using Google Container Engine (GKE), deploy two web services using Helm. The applications can be written in any language and/or framework/technology, and has to SECURELY expose the following paths:

Path: /app1

Content: the proxied content from the first app

Path: /app2

Content: the proxied content from the second app

BONUS:

- Install Prometheus on the Kubernetes cluster and scrape the applications metrics
- Build a simple pipeline using Jenkins to deploy the services above.

Please push all your code to a public git repository with a README.md on how to use/install.
